

OPTIMAL STRUCTURAL RECONSTRUCTION OF REGIONAL SOCIO-ECONOMIC SYSTEMS

The new vision of the socio-economic development problems of region involves a thorough understanding of the theoretical views of modernity on the region as a dynamic system with defined certain territorial and sectoral structure and requires consideration of new elements of productive forces in a multifaceted conception principles of regional development under the condition of effective public administration reform.

Ineffective regulation of market transformation of regional socio-economic state systems leads to problems of socio-economic development of the territorial organization of productive forces. In condition of scarcity of natural, material, economic resources and the difficult environmental situation in the country, transformation processes needed ensure the reproduction of natural and development of social regional systems.

The unsatisfactory state of solving social and economic problems of the regions level indicates the lack of a balanced state regional policy, which negatively affects the economic development of the regions, leads to deepening disparities in the territorial structure of the national economy and social sphere. All this, of course, consequence of the transformation crisis in Ukraine.

The whole reforms period in Ukraine is characterized by processes of deindustrialization of the economy, the presence of significant production potential, which not used and restrains the real growth of productivity and living standards, innovative reproduction, especially reproduction of a person capable of effective living in new conditions [1, p. 25]. For many years, decisions on the regulation of regional development significantly depended on subjective factors, including political processes, which did not always accord the officially defined priorities and objectives of regional policy [2, p. 14].

Negative trends in the regions development require a comprehensive approach to overcoming them, intensifying transformation processes, directing on solve economic, social and environmental problems. The optimal combination of objects of nature and society is necessary for the creation of regional natural and social systems that have the ability to sustainable development and reproduction.

One of the important problems of regional development of Ukraine is regional economic disintegration, which has manifestation in the optimal restructuring of the economic space, weakening of interregional connections, due to increasing closure of regional economic complexes and increasing the role of foreign economic relations. The optimal structural restructuring of the country's economic space involves taking full account of the level of development of socio-economic potentials of the regions and the efficiency of the national economy.

Economic space is an integrated and interconnected system of economic relations and the available resource base that is constantly evolving under constant management with budget, tax, financial and social policy and market infrastructure. Economic space combines forms of economic organization and resettlement. Signs of economic space are the relationship, specificity of location and density.

Depending on the structural adjustment, character and scale, the following types of transformation processes of economic space are distinguished: organizational, structural, functional, spatial and managerial. Types of transformation processes are based on the basic processes of market transformation of socio-economic systems. For optimal structural restructuring of regional socio-economic systems, it is necessary to structurally regulate the economy of the regions through structural adjustment, which is determined by the level of socio-economic potential of the regions and the overall efficiency of the national economy.

The main purpose of public management of regional socio-economic systems is to ensure the unity and integrity of the country, strengthening the single economic space, Ukrainian market, levelling the socio-economic situation in the regions [3, p. 120].

The optimal structural restructuring of the regional economy is based on the main provisions of the concept of sustainable development, transferred to the regional plane,

taking into account the principles of regional development of general system, legal and state nature.

The main mechanisms for the implementation of the restructuring of socio-economic development of the region include a number of tools and activities, grouped in the following areas: spatial development of Ukraine; budgets and taxes in regional policy; investments in regional policy; green economy, social development of the regions of Ukraine; administrative centres of the regions in solving regional policy problems; development of territories with special status; cross-border cooperation of the country's regions; development of infrastructure facilities; state management of regional development; formation, implementation of interregional, regional target programs.

Optimal restructuring of the economic space and ensuring economic growth require the expansion of the rights and independence of the regions. Regional development management should ensure the creation of appropriate conditions for the residents, efficient use of natural resources and deepening of integration processes. Implementation of the main provisions of the new paradigm of socio-economic development of the region is possible only with the formation of a base on institutional framework, which is to develop tools and mechanisms for regional socio-economic systems, which serve as the economic basis for solving regional socio-economic policy.
